Dedicated to our grandmoms,  
who perhaps know more about granular materials  
than anyone of us ....

## ACKNOWLEDGEMENTS

Completing a doctoral work makes the person going through the process realize that self-determination and hard work alone do not lead to a dissertation. I am grateful to my advisor, Professor Jerry Gollub, for his guidance and critiques that surely have critical influence on my development in scientific thinking. In particular, I would like to acknowledge his efforts in coaching my English: it is unforgettable for me to see that my advisor still tireless pointing out a few misused semi-colons in my first complete draft, while he was suffering a severe back pain. And I thank Paulo Arratia, whose help and companion have had very positive impacts on my last year in the lab at Haverford.

During the initial exploration of this dissertation project, I was so fortunate to have Greg Voth as both a mentor and a great friend. This work would not have come into existence without the extensive discussions with him, or without his compassionate supports through various difficult times. The conversation in which he brought in the idea of slice fluorescent imaging led to one of the defining moments of this project. Special thanks go to Keng-Hui Lin, who assisted me tremendously in selecting index-matching fluid and fluorescent dye, and to Professor Arjun Yodh's generosity, which made his laboratory a pleasant place where I felt free to perform some preliminary tests. The interactions with John Crocker over years have been interesting: I appreciate his introducing me to the theories behind his particle tracking algorithms, and his commenting on my final dissertation. I also thank Professor Tom Lubensky for fruitful discussions at various stages. I appreciate the opportunity working with Wolfgang Losert in my first year joining the Gollub group. The course work at Penn in my early years of graduate school has been beneficial, and I treasure the time and the memory of being with the comrades in the "zoo".

Working with Bruce Boyes in machining has been a wonderful experience. With his expertise and clever idea, we have overcome several difficulties, some of which demand the precisions that are normally beyond the reach of our available tools. The accurate assembly of the apparatus that makes possible the simultaneous volume and force measurement proves that our efforts and cares are worthwhile. In addition, I enjoyed the private machining lessons that he tailored for me, as well as the sharing of his wisdom of life. Also, it is rewarding to have the opportunities working with Haverford College undergraduates,

among whom Nick Travers has made substantial contributions to this project and assured me that the apparatus is now in good hands. And I thank Kay Warner for her secretarial help and the friendly chatting from time to time.

I owe an enormous amount to my Taiwanese friends at Penn and around this country. The intellectual and spiritual interactions with them have certainly enriched my life, and have made Philadelphia an enduring memory for my wife and me. And I definitely would not be finishing my degree without the consistent support and understanding of my parents throughout the long journey. Their open minds gave me the most precious that anyone can image for a person's youth, and they also made themselves my trustworthy friends, a relationship that I will cherish for the rest of my life. Last and the foremost, my deepest gratitude goes to my dear wife, Sylvia. She has always been by my side, whether it is in those lab hours for assembling the apparatus during the winter break years ago, or in the days of completing this thesis. There is no doubt in my mind that Hui-Hsuan Chao, the heroine behind the scene, is the co-author of the dissertation.
